

I-40 Bridge, Rio Puerco, Gallup, New Mexico

(Section 14)

The project area is in northwest New Mexico. The study evaluated several options to protect Interstate 40 from erosion caused by the Rio Puerco. The recommended plan consists of 1,200 linear feet of gabion mat. We anticipate construction to begin in November 2003, contingent on the State's ability to provide their required funding.
